

Put the form on WordPress, Wix, Shopify and more

Step by step for WordPress, Elementor, Divi, Wix, Squarespace, Shopify, Webflow, Joomla, Google Sites and hand-written HTML, or a button that opens the form.

Your quote form already works on its own page. Putting it on your website means pasting a short snippet where your site accepts HTML, and almost every site builder has a place for that. Below are the steps for the common ones. What the form shows and how requests reach you is set in Shr3Dt, as [Add the quote form to your website](#) explains.

Before you start

1. In Shr3Dt, open Settings, then the Quote form tab. Under “Your public quote form” you'll find your form's address and the snippet, ready to copy, with your shop's own address in it instead of `your-shop`.
2. Open the address in a browser and try the form once, so you know what visitors will see.
3. Make a page for it on your site, for example “3D printing quote”, and put a link to it in your menu.

The snippet looks like this:

```
<iframe
  id="shr3dt-quote-form"
  src="https://shr3dt.com/your-shop/request-quote"
  style="width: 100%; height: 500px; border: 0;"
  title="Get a 3D print quote"
></iframe>
<script>
  window.addEventListener("message", function (e) {
    if (e.data && e.data.type === "shr3dt:resize") {
      var f = document.getElementById("shr3dt-quote-form");
      if (f && e.source === f.contentWindow) f.style.height = e.data.height + "px";
    }
  })
}
```

```
});  
</script>
```

The frame starts 500 px tall and the script grows it to fit the form as customers add parts, so there's never a scrollbar inside it. Paste it as it is: there are no keys to add and nothing to set up on our side, whatever your domain.

WordPress

Block editor

1. Open the page and click the **+** where the form should go.
2. Search for **Custom HTML** and add that block.
3. Paste the snippet, click **Preview** to see the form, then **Update** or **Publish**.

In the classic editor, switch to the **Text** tab (not Visual) and paste it there.

Elementor, Divi and other page builders

- Elementor: drag the **HTML** widget onto the page and paste the snippet into its code box.
- Divi: add a **Code** module and paste the snippet.
- WPBakery: add a **Raw HTML** element.
- Beaver Builder: add an **HTML** module.

If the form disappears when you save: WordPress lets only administrators save scripts and frames, so ask one to paste it. On WordPress.com, the hosted service, the lower plans strip them when the page is published; you need a plan that allows plugins, or use a [button](#) instead.

Wix

Wix shows embedded code inside a frame of its own, so the snippet can't resize it. Give the form its own address and a fixed height instead:

1. In the editor, open **Add Elements**, then **Embed Code**, and choose **Embed a site**.
2. Click the new element, choose **Enter Website Address**, paste your form's address (the `https://shr3dt.com/.../request-quote` one) and click **Apply**.
3. Stretch the element to the full width of the section and drag its bottom edge down to about 1600 px. The form scrolls inside it if a customer adds many parts.
4. Check the mobile view too, and make the element tall there as well.

In Wix Studio the same element is under **Add**, then **Embed & Social**.

Squarespace

1. Edit the page and click **Add block** (or the + in a section).
2. Choose **Code**, paste the snippet, and leave the mode on HTML.
3. Turn off **Display Source** if it's on, then save the page.

Squarespace runs scripts and frames in code blocks on its Core plan and above (Business and Commerce on older plans). On the Basic plan the block stays empty, so use a [button](#) instead.

Shopify

1. In your Shopify admin go to **Online Store**, then **Pages**, and add a page, for example “3D printing quote”.
2. Go to **Online Store**, then **Themes**, and click **Customize**. From the page menu at the top, open **Pages** and create a new template, for example “quote”.
3. In that template click **Add section**, choose **Custom Liquid**, paste the snippet and click **Save**.
4. Back on your page, under **Theme template**, choose the new template and save.

A template of its own keeps the form on this one page rather than on every page of your store.

Webflow

1. Open the page in the Designer and press **A** (or the + button) to open the Add panel.
2. Drag a **Code Embed** element where the form should go.
3. Paste the snippet, click **Save & Close**, then publish the site.

The Designer may show a grey box: the form appears on the published site. Code Embed needs a paid site plan.

Joomla

1. Go to **Content**, then **Site Modules**, click **New** and choose **Custom**.
2. Click **Toggle Editor** so you see plain HTML, and paste the snippet.
3. Pick a position on the page, assign the module to your quote page's menu item, and save.

If Joomla removes the frame on save, open **System**, then **Global Configuration**, then **Text Filters**, and set your own user group to **No Filtering**.

Google Sites

Like Wix, Google Sites keeps embeds in a frame of its own, so use the fixed-height version:

```
<iframe
  src="https://shr3dt.com/your-shop/request-quote"
  style="width: 100%; height: 1600px; border: 0;"
  title="Get a 3D print quote"
></iframe>
```

1. Click **Embed** in the Insert panel, choose the **Embed code** tab, paste the code above with your own address, then **Next** and **Insert**.
2. Drag the box's bottom edge down so the whole frame shows, then publish.

Your own HTML

If you or your developer write the site by hand, paste the snippet into the page's body where the form should appear. If your site sends a Content Security Policy, allow the frame with `frame-src https://shr3dt.com`.

Other builders

GoDaddy, Hostinger, Jimdo, Square Online and most others have an element called something like **Embed**, **HTML**, **Code** or **Custom code**. Paste the snippet into it. If the form shows with a scrollbar or cut off, the builder keeps embeds in a frame of its own: use the fixed-height version from the Google Sites steps and make the element tall.

Or link to the form with a button

Not every site takes embedded code, and you may simply prefer a button. Your form's address works as a page of its own, on phones too, so any button can open it: put the address in your builder's button or menu link. If you're writing HTML:

```
<a href="https://shr3dt.com/your-shop/request-quote"
  style="display: inline-block; padding: 12px 22px; border-radius: 8px;
  background: #6e3e4d; color: #fff; font-weight: 600; text-decoration: none;">
```

Get a 3D print quote

Check it works

1. Open your page on a computer and on a phone. The whole form should show, with no inner scrollbar on the snippet version.
2. Upload a test file and check the price appears.
3. Send a request with your own email address. It arrives in Quotes marked “website”, your team gets an email, and so do you as the customer. Delete or reject the test request afterwards.

If something's wrong

- **The frame is empty or says it refused to connect:** check the address starts with `https://` and has your shop's own part, exactly as Settings shows it.
- **The form is cut off or scrolls inside the frame:** the script didn't run. Either the builder removed it (paste the snippet again where scripts are allowed) or it keeps embeds in its own frame (make the element taller).
- **The block vanishes when you save:** your plan or user role doesn't allow frames. Use the button instead.
- **Two forms on one page:** paste the snippet only once per page; it looks for the frame by its id.

Stuck with a builder not listed here? [Send us a message](#) with its name and we'll help.
